Configuring Secure Shell

The Secure Shell (SSH) feature is an application and a protocol that provides a secure replacement to the Berkeley r-tools. The protocol secures sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Two versions of SSH are available: SSH Version 1 and SSH Version 2. Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only. For information about SSH Version 2, see the "Secure Shell Version 2 Support" feature module.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring SSH

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

- Download the required image on the device. The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.) For information about downloading a software image, see the *Loading and Managing System Images Configuration Guide*.
- Configure a hostname and host domain for your device by using the **hostname** and **ip domain-name** commands in global configuration mode.
- Generate a Rivest, Shamir, and Adleman (RSA) key pair for your device. This key pair automatically enables SSH and remote authentication when the **crypto key generate rsa** command is entered in global configuration mode.

Note

To delete the RSA key pair, use the **crypto key zeroize rsa** global configuration command. Once you delete the RSA key pair, you automatically disable the SSH server.

• Configure user authentication for local or remote access. You can configure authentication with or without authentication, authorization, and accounting (AAA). For more information, see the *Authentication, Authorization, and Accounting Configuration Guide*.

Restrictions for Configuring SSH

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

- The Secure Shell (SSH) server and SSH client are supported on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software images only. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- Execution shell is the only application supported.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.

Information About Secure Shell (SSH)

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

SSH Server

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

The Secure Shell (SSH) Server feature enables an SSH client to make a secure, encrypted connection to a Cisco device. This connection provides functionality that is similar to that of an inbound Telnet connection. Before SSH, security was limited to Telnet security. SSH allows a strong encryption to be used with the Cisco software authentication. The SSH server in Cisco software works with publicly and commercially available SSH clients.

SSH Integrated Client

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH client in Cisco software works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication. User authentication is performed like that in the Telnet session to the device. The user authentication mechanisms supported for SSH are RADIUS, TACACS+, and the use of locally stored usernames and passwords.

Note

The SSH client functionality is available only when the SSH server is enabled.

RSA Authentication Support

Rivest, Shamir, and Adleman (RSA) authentication available in Secure Shell (SSH) clients is not supported on the SSH server for Cisco software by default. For more information about RSA authentication support, see the "Configuring a Router for SSH Version 2 Using RSA Pairs" section of the "Secure Shell Version 2 Support" module.

How to Configure SSH

Configuring an SSH Server

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip ssh {timeout seconds | authentication-retries integer}
- 4. ip ssh rekey {time time | volume volume}
- 5. exit
- 6. show ip ssh

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip ssh {timeout seconds	Configures Secure Shell (SSH) control parameters.
	authentication-retries integer} Example:	Note This command can also be used to establish the number of password prompts provided to the user. The number is the lower of the following two values:
	Device(config)# ip ssh timeout 30	 Value proposed by the client using the ssh -o numberofpasswordprompt command.
		 Value configured on the device using the ip ssh authentication-retries integer command, plus one.

	Command or Action	Purpose
Step 4	ip ssh rekey {time volume volume}	(Optional) Configures a time-based rekey or a volume-based rekey for SSH.
	Example:	
	Device(config)# ip ssh rekey time 108	
Step 5	exit	Returns to privileged EXEC mode.
	Example: Device(config)# exit	
Step 6	show ip ssh	(Optional) Verifies that the SSH server is enabled and displays the version and configuration data for the SSH connection.
	Example: Device# show ip ssh	

Invoking an SSH Client

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

Perform this task to invoke the Secure Shell (SSH) client. The SSH client runs in user EXEC mode and has no specific configuration tasks.

SUMMARY STEPS

- 1. enable
- **2. ssh** -**l** username -**vrf** vrf-name ip-address

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	ssh -l username -vrf vrf-name ip-address	Invokes the SSH client to connect to an IP host or address in the specified virtual routing and forwarding (VRF) instance.
	Example:	
	Device# ssh -l user1 -vrf vrf1 192.0.2.1	

Troubleshooting Tips

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

- If your Secure Shell (SSH) configuration commands are rejected as illegal commands, you have not successfully generated an Rivest, Shamir, and Adleman (RSA) key pair for your device. Make sure that you have specified a hostname and domain. Then use the **crypto key generate rsa** command to generate an RSA key pair and enable the SSH server.
- When configuring the RSA key pair, you might encounter the following error messages:
 - No hostname specified.
 You must configure a hostname for the device using the **hostname** global configuration command.
 See the "IPsec and Quality of Service" module for more information.
 - No domain specified.
 You must configure a host domain for the device using the ip domain-name global configuration command. See the "IPsec and Quality of Service" module for more information
- The number of allowable SSH connections is limited to the maximum number of vtys configured for the device. Each SSH connection uses a vty resource.
- SSH uses either local security or the security protocol that is configured through AAA on your device for user authentication. When configuring Authentication, Authorization, and Accounting (AAA), you must ensure that AAA is disabled on the console for user authentication. AAA authorization is disabled on the console by default. If AAA authorization is enabled on the console, disable it by configuring the no aaa authorization console command during the AAA configuration stage.

Configuration Examples for SSH

Example SSH on a Cisco 7200 Series Router

In the following example, SSH is configured on a Cisco 7200 with a timeout that is not to exceed 60 seconds and no more than 2 authentication retries. Before the SSH server feature is configured on the router, TACACS+ is specified as the method of authentication.

```
hostname Router72K
aaa new-model
aaa authentication login default tacacs+
aaa authentication login aaa7200kw none
enable password password
username username1 password 0 password1
username username2 password 0 password2
ip subnet-zero
no ip domain-lookup
```

```
ip domain-name cisco.com
! Enter the ssh commands.
ip ssh timeout 60
ip ssh authentication-retries 2
controller E1 2/0
controller E1 2/1
interface Ethernet1/0
ip address 192.168.110.2 255.255.255.0 secondary
ip address 192.168.109.2 255.255.255.0
no ip directed-broadcast
no ip route-cache
no ip mroute-cache
no keepalive
no cdp enable
interface Ethernet1/1
no ip address
no ip directed-broadcast
no ip route-cache
no ip mroute-cache
shutdown
no cdp enable
interface Ethernet1/2
no ip address
no ip directed-broadcast
no ip route-cache
no ip mroute-cache
shutdown
no cdp enable
no ip classless
ip route 192.168.1.0 255.255.255.0 10.1.10.1
ip route 192.168.9.0 255.255.255.0 10.1.1.1
ip route 192.168.10.0 255.255.255.0 10.1.1.1
map-list atm
ip 10.1.10.1 atm-vc 7 broadcast
no cdp run
tacacs-server host 192.168.109.216 port 9000
tacacs-server key cisco
radius-server host 192.168.109.216 auth-port 1650 acct-port 1651
radius-server key cisco
line con 0
exec-timeout 0 0
login authentication aaa7200kw
transport input none
line aux 0
line vty 0 4
password password
end
```

Example SSH on a Cisco 7500 Series Router

In the following example, SSH is configured on a Cisco 7500 with a timeout that is not to exceed 60 seconds and no more than 5 authentication retries. Before the SSH server feature is configured on the router, RADIUS is specified as the method of authentication.

```
hostname Router75K

aaa new-model

aaa authentication login default radius

aaa authentication login aaa7500kw none

enable password password

username username1 password 0 password1

username username2 password 0 password2

ip subnet-zero

no ip cef

no ip domain-lookup

ip domain-name cisco.com

! Enter ssh commands.

ip ssh timeout 60
```

```
ip ssh authentication-retries 5

Example: Verifying SSH

Note

Unless otherwise noted, the term "SSH" denotes "SSH Version 1" only.

To verify that the Secure Shell (SSH) server is enabled and to display the version and configuration data for your SSH connection, use the **show ip ssh** command. The following example shows that SSH is enabled:

```
Device# show ip ssh

SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
The following example shows that SSH is disabled:

Device# show ip ssh
```

 $\$ {\tt SSH}$ has not been enabled

To verify the status of your SSH server connections, use the **show ssh** command. The following example shows the SSH server connections on the device when SSH is enabled:

Device# show ssh

 $\begin{array}{cccc} \text{Connection} & \text{Version} & \text{Encryption State Username} \\ \text{O 1.5 3DES Session Started} & \text{guest} \end{array}$

The following example shows that SSH is disabled:

Device# show ssh

%No SSH server connections running.

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Configuring Secure Shell

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Configuring Secure Shell

Feature Name	Releases	Feature Information
Secure Shell	12.0(5)S 15.0(2)SE 15.1(1)SY 15.2(1)E	The Secure Shell (SSH) feature is an application and a protocol that provides a secure replacement to the Berkeley r-tools. The protocol secures sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Two versions of SSH are available: SSH Version 1 and SSH Version 2. This document describes SSH Version 1. This document also includes information about the Secure Shell SSH Version 1 Integrated Client feature and the Secure Shell SSH Version 1 Server Support feature. Both features are part of the Secure Shell functionality.

Reverse SSH Enhancements

The Reverse SSH Enhancements feature, which is supported for SSH Version 1 and 2, provides an alternative way to configure reverse Secure Shell (SSH) so that separate lines do not need to be configured for every terminal or auxiliary line on which SSH must be enabled. This feature also eliminates the rotary-group limitation.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Reverse SSH Enhancements

- · SSH must be enabled.
- The SSH client and server must be running the same version of SSH.

Restrictions for Reverse SSH Enhancements

• The -I keyword and *userid*: {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

Information About Reverse SSH Enhancements

Reverse Telnet

Cisco IOS software has for quite some time included a feature called Reverse telnet, whereby you can telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnet has often been used to connect a Cisco IOS router that has many terminal lines to the consoles of other Cisco IOS routers or to other devices. Telnet makes it easy to reach the router console from anywhere simply by telnet to the terminal server on a specific line. This telnet approach can be used to configure a router even if all network connectivity to that router is disconnected. Reverse telnet also allows modems that are attached to Cisco IOS routers to be used for dial-out (usually with a rotary device).

Reverse SSH

Reverse telnet can be accomplished using SSH. Unlike reverse telnet, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation. For information on the alternative method of configuring reverse SSH, see How to Configure Reverse SSH Enhancements, on page 14."

How to Configure Reverse SSH Enhancements

Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. line** *line-number ending-line-number*
- 4. no exec
- 5. login authentication listname
- 6. transport input ssh
- 7. exit
- 8. exit
- **9. ssh** -**l** userid : {number} {ip-address}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	line line-number ending-line-number	Identifies a line for configuration and enters line configuration mode.
	Example:	
	Router# line 1 3	
Step 4	no exec	Disables EXEC processing on a line.
	Example:	
	Router (config-line)# no exec	
Step 5	login authentication listname	Defines a login authentication mechanism for the lines.
	Example:	Note The authentication method must use a username and password.
	Router (config-line)# login authentication default	

	Command or Action	Purpose
Step 6	transport input ssh	Defines which protocols to use to connect to a specific line of the router.
	Example:	The ssh keyword must be used for the Reverse SSH
	Router (config-line)# transport input ssh	Enhancements feature.
Step 7	exit	Exits line configuration mode.
	Example:	
	Router (config-line)# exit	
Step 8	exit	Exits global configuration mode.
	Example:	
	Router (config)# exit	
Step 9	ssh -l userid : {number} {ip-address}	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server.
	Example:	• useridUser ID.
	Router# ssh -l lab:1 router.example.com	•:Signifies that a port number and terminal IP address will follow the userid argument.
		• numberTerminal or auxiliary line number.
		• <i>ip-address</i> Terminal server IP address.
		Note The <i>userid</i> argument and :rotary {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

Configuring Reverse SSH for Modem Access

To configure Reverse SSH for modem access, perform the steps shown in the "SUMMARY STEPS" section below.

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. line** *line-number ending-line-number*
- 4. no exec
- 5. login authentication listname
- 6. rotary group
- 7. transport input ssh
- 8. exit
- 9. exit
- **10.** ssh -l userid :rotary {number} {ip-address}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	line line-number ending-line-number	Identifies a line for configuration and enters line configuration mode.
	Example:	
	Router# line 1 200	
Step 4	no exec	Disables EXEC processing on a line.
	Example:	
	Router (config-line)# no exec	
Step 5	login authentication listname	Defines a login authentication mechanism for the lines.
	Example:	Note The authentication method must use a username and password.
	Router (config-line)# login authentication default	

	Command or Action	Purpose
Step 6	rotary group	Defines a group of lines consisting of one or more virtual terminal lines or one auxiliary port line.
	Example:	
	Router (config-line)# rotary 1	
Step 7	transport input ssh	Defines which protocols to use to connect to a specific line of the router.
	Example: Router (config-line) # transport input ssh	The ssh keyword must be used for the Reverse SSH Enhancements feature.
Step 8	exit	Exits line configuration mode.
	<pre>Example: Router (config-line) # exit</pre>	
Step 9	exit	Exits global configuration mode.
	<pre>Example: Router (config) # exit</pre>	
Step 10	ssh -l userid :rotary {number} {ip-address}	Specifies the user ID to use when logging in on the remote networking device that is running the SSH server.
	Example:	• useridUser ID.
	Router# ssh -l lab:rotary1 router.example.com	• :Signifies that a port number and terminal IP address will follow the <i>userid</i> argument.
		• numberTerminal or auxiliary line number.
		• <i>ip-address</i> Terminal server IP address.
		Note The <i>userid</i> argument and :rotary{number}{ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

Troubleshooting Reverse SSH on the Client

To troubleshoot the reverse SSH configuration on the client (remote device), perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. debug ip ssh client

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	debug ip ssh client	Displays debugging messages for the SSH client.
	Example:	
	Router# debug ip ssh client	

Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.

SUMMARY STEPS

- 1. enable
- 2. debug ip ssh
- 3. show ssh
- 4. show line

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	debug ip ssh	Displays debugging messages for the SSH server.
	Example:	
	Router# debug ip ssh	

	Command or Action	Purpose
Step 3	show ssh	Displays the status of the SSH server connections.
	Example:	
	Router# show ssh	
Step 4	show line	Displays parameters of a terminal line.
	Example:	
	Router# show line	

Configuration Examples for Reverse SSH Enhancements

Example Reverse SSH Console Access

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

Terminal Server Configuration

```
line 1 3
  no exec
  login authentication default
  transport input ssh
```

Client Configuration

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

```
ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com
```

Example Reverse SSH Modem Access

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

```
line 1 200
  no exec
  login authentication default
  rotary 1
  transport input ssh
  exit
```

The following command shows that reverse SSH will connect to the first free line in the rotary group:

ssh -l lab:rotary1 router.example.com

Additional References

Feature Information for Reverse SSH Enhancements

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2: Feature Information for Reverse SSH Enhancements

Feature Name	Releases	Feature Information
Reverse SSH Enhancements	12.3(11)T	The Reverse SSH Enhancements feature, which is supported for SSH Version 1 and 2, provides an alternative way to configure reverse Secure Shell (SSH) so that separate lines do not need to be configured for every terminal or auxiliary line on which SSH must be enabled. This feature also eliminates the rotary-group limitation. This feature was introduced in Cisco IOS Release 12.3(11)T. The following command was introduced: ssh.

Feature Information for Reverse SSH Enhancements

Secure Copy

The Secure Copy (SCP) feature provides a secure and authenticated method for copying device configurations or device image files. SCP relies on Secure Shell (SSH), an application and protocol that provide a secure replacement for the Berkeley r-tools suite (Berkeley university's own set of networking applications). This document provides the procedure to configure a Cisco device for SCP server-side functionality.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Secure Copy

• Before enabling Secure Copy (SCP), you must correctly configure Secure Shell (SSH), authentication, and authorization on the device.

• Because SCP relies on SSH for its secure transport, the device must have a Rivest, Shamir, and Adelman (RSA) key pair.

Information About Secure Copy

How Secure Copy Works

The behavior of Secure Copy (SCP) is similar to that of remote copy (RCP), which comes from the Berkeley r-tools suite (Berkeley university's own set of networking applications), except that SCP relies on Secure Shell (SSH) for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so that the device can determine whether the user has the correct privilege level.

SCP allows a user with appropriate authorization to copy any file that exists in the Cisco IOS File System (IFS) to and from a device by using the **copy** command. An authorized administrator may also perform this action from a workstation.

Enable the SCP option while using the pscp.exe file with the Cisco software.

How to Configure Secure Copy

Configuring Secure Copy

To configure a Cisco device for Secure Copy (SCP) server-side functionality, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- **4.** aaa authentication login {default | list-name} method1 [method2...]
- **5.** aaa authorization {network | exec | commands level | reverse-access | configuration} {default | list-name} [method1 [method2...]]
- **6. username** name [**privilege** level] **password** encryption-type encrypted-password
- 7. ip scp server enable
- 8. exit
- 9. show running-config
- 10. debug ip scp

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa new-model	Sets AAA authentication at login.
	Example:	
	Device(config)# aaa new-model	
Step 4	aaa authentication login {default list-name} method1 [method2]	Enables the AAA access control system.
	Example:	
	Device(config) # aaa authentication login default group tacacs+	
Step 5	aaa authorization {network exec commands level	Sets parameters that restrict user access to a network.
	reverse-access configuration { default list-name } [method1 [method2]]	Note The exec keyword runs authorization to determine if the user is allowed to run an EXEC
	Example:	shell; therefore, you must use the exec keyword when you configure SCP.
	Device(config)# aaa authorization exec default group tacacs+	
Step 6	username name [privilege level] password	Establishes a username-based authentication system.
	encryption-type encrypted-password	Note You may omit this step if a network-based authentication mechanism, such as TACACS+
	Example:	or RADIUS, has been configured.
	Device(config)# username superuser privilege 2 password 0 superpassword	
Step 7	ip scp server enable	Enables SCP server-side functionality.
	Example:	
	Device(config)# ip scp server enable	

	Command or Action	Purpose
Step 8	exit	Exits global configuration mode and returns to privileged EXEC mode.
	Example:	
	Device(config)# exit	
Step 9	show running-config	(Optional) Displays the SCP server-side functionality.
	Example:	
	Device# show running-config	
Step 10	debug ip scp	(Optional) Troubleshoots SCP authentication problems.
	Example:	
	Device# debug ip scp	

Configuration Examples for Secure Copy

Example: Secure Copy Configuration Using Local Authentication

The following example shows how to configure the server-side functionality of Secure Copy (SCP). This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work. aaa new-model aaa authentication login default local aaa authorization exec default local username user1 privilege 15 password 0 lab ! SSH must be configured and functioning properly. ip scp server enable
```

Example: Secure Copy Configuration Using Network-Based Authentication

The following example shows how to configure the server-side functionality of Secure Copy (SCP) using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly in order for SCP to work.

aaa new-model

aaa authentication login default group tacacs+

aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip scp server enable
```

Feature Information for Secure Copy

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 3: Feature Information for Secure Copy

Feature Name	Releases	Feature Information
Secure Copy	12.0(21)S 12.2(2)T 12.2(25)S	The Secure Copy (SCP) feature provides a secure and authenticated method for copying device configurations or device image files. SCP relies on Secure Shell (SSH), an application and protocol that provide a secure replacement for the Berkeley r-tools suite. The following commands were introduced or modified: debug ip scp, ip scp server enable.

Glossary

AAA—authentication, authorization, and accounting. A framework of security services that provide the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

RCP—remote copy. Relies on Remote Shell (Berkeley r-tools suite) for security; RCP copies files such as device images and startup configurations to and from devices.

SCP—secure copy. Relies on SSH for security; SCP support allows secure and authenticated copying of anything that exists in the Cisco IOS File System (IFS). SCP is derived from RCP.

SSH—Secure Shell. An application and protocol that provide a secure replacement for the Berkeley r-tools suite. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similar to the Berkeley rexec and rsh tools. SSH Version 1 is implemented in the Cisco software.

Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Secure Shell Version 2 Support

- Before configuring SSH, ensure that the required image is loaded on your device. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image depending on your release.
- You have to use a SSH remote device that supports SSH Version 2 and connect to a Cisco device.
- SCP relies on authentication, authorization, and accounting (AAA) to function correctly. Therefore, AAA must be configured on the device to enable the secure copy protocol on the SSH Server.

The SSH Version 2 server and the SSH Version 2 client are supported on your Cisco software, depending on your release. (The SSH client runs both the SSH Version 1 protocol and the SSH Version 2 protocol. The SSH client is supported in both k8 and k9 images depending on your release.)

For more information about downloading a software image, refer to the *Configuration Fundamentals Configuration Guide*.

Restrictions for Secure Shell Version 2 Support

- Secure Shell (SSH) servers and SSH clients are supported in Triple Data Encryption Standard (3DES) software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Rivest, Shamir, and Adleman (RSA) key generation is an SSH server-side requirement. Devices that act as SSH clients need not generate RSA keys.
- The RSA key pair size must be greater than or equal to 768 bits.
- The following features are not supported:
 - · Port forwarding
 - Compression

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The Secure Shell Version 2 Support feature allows you to configure SSH Version 2.

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The **ip ssh version** command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.

Note

SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the **ip ssh version** command and specify Version 2.

The **ip ssh rsa keypair-name** command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the **ip ssh rsa keypair-name** command, you can overcome this behavior. If you configure the **ip ssh rsa keypair-name** command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

Note

The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

Secure Shell Version 2 Enhancements

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The **ip ssh dh min size** command configures the modulus size on the SSH server. In addition to this, the **ssh** command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The **debug ip ssh** command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the **debug ip ssh** command with a keyword, messages are limited to information specified by the keyword.

Secure Shell Version 2 Enhancements for RSA Keys

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.

User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user's public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a "Server Authentication Failed" message.

Note

Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

Note

RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

Note

For server authentication, configure the RSA public key of the server manually and configure the **ip ssh stricthostkeycheck** command on the Cisco SSH client.

SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the "Configuring SNMP Support" module in the SNMP Configuration Guide.

Note

When you configure the **snmp-server host** command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server. For an example of an SNMP trap generation configuration, see the "Example: Setting an SNMP Trap section.

You must also enable SNMP debugging using the **debug snmp packet** command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session. For an example of SNMP debugging, see the "Example: SNMP Debugging section.

SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

For examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically enabled, see the "Examples: SSH Keyboard Interactive Authentication, on page 50" section.

How to Configure Secure Shell Version 2 Support

Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. hostname name
- 4. ip domain-name name
- 5. crypto key generate rsa
- **6.** ip ssh [time-out seconds | authentication-retries integer]
- 7. ip ssh version [1 | 2]
- 8. exit

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	hostname name	Configures a hostname for your device.
	Example:	
	Device(config)# hostname cisco7200	
Step 4	ip domain-name name	Configures a domain name for your device.
	Example:	
	cisco7200(config)# ip domain-name example.com	
Step 5	crypto key generate rsa	Enables the SSH server for local and remote authentication.
	Example:	
	cisco7200(config)# crypto key generate rsa	
Step 6	ip ssh [time-out seconds authentication-retries integer]	(Optional) Configures SSH control variables on your device.
	Example:	
	cisco7200(config)# ip ssh time-out 120	
Step 7	ip ssh version [1 2]	(Optional) Specifies the version of SSH to be run on your device.
	Example:	
	cisco7200(config)# ip ssh version 1	
Step 8	exit	Exits global configuration mode and enters privileged EXEC mode.
	Example:	• Use no hostname command to return to the default
	cisco7200(config)# exit	host.

Configuring a Device for SSH Version 2 Using RSA Key Pairs

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip ssh rsa keypair-name keypair-name
- 4. crypto key generate rsa usage-keys label key-label modulus modulus-size
- **5.** ip ssh [time-out seconds | authentication-retries integer]
- 6. ip ssh version 2
- 7. exit

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip ssh rsa keypair-name keypair-name	Specifies the RSA key pair to be used for SSH.
	Example:	Note A Cisco device can have many RSA key pairs.
	Device(config)# ip ssh rsa keypair-name sshkeys	
Step 4	crypto key generate rsa usage-keys label key-label modulus modulus-size	Enables the SSH server for local and remote authentication on the device.
	Example:	• For SSH Version 2, the modulus size must be at least 768 bits.
	Device(config)# crypto key generate rsa usage-keys label sshkeys modulus 768	Note To delete the RSA key pair, use the crypto key zeroize rsa command. When you delete the RSA key pair, you automatically disable the SSH server.
Step 5	ip ssh [time-out seconds authentication-retries integer]	Configures SSH control variables on your device.

	Command or Action	Purpose
	Example:	
	Device(config)# ip ssh time-out 12	
Step 6	ip ssh version 2	Specifies the version of SSH to be run on the device.
	Example:	
	Device(config)# ip ssh version 2	
Step 7	exit	Exits global configuration mode and enters privileged EXEC mode.
	Example:	
	Device(config)# exit	

Configuring the Cisco SSH Server to Perform RSA-Based User Authentication

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. hostname name
- 4. ip domain-name name
- 5. crypto key generate rsa
- 6. ip ssh pubkey-chain
- 7. username username
- 8. key-string
- 9. key-hash key-type key-name
- **10**. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	hostname name	Specifies the hostname.
	Example:	
	Device(config) # hostname host1	
Step 4	ip domain-name name	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
	Example:	
	host1(config)# ip domain-name name1	
Step 5	crypto key generate rsa	Generates RSA key pairs.
	Example:	
	host1(config)# crypto key generate rsa	
Step 6	ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.
	Example:	The user authentication is successful if the RSA public key stored
	host1(config)# ip ssh pubkey-chain	on the server is verified with the public or the private key pair stored on the client.
Step 7	username username	Configures the SSH username and enters public-key user configuration mode.
	Example:	
	host1(conf-ssh-pubkey)# username user1	
Step 8	key-string	Specifies the RSA public key of the remote peer and enters public-key data configuration mode.
	Example:	Note You can obtain the public key value from an open SSH client;
	host1(conf-ssh-pubkey-user)# key-string	that is, from the .ssh/id_rsa.pub file.
Step 9	key-hash key-type key-name	(Optional) Specifies the SSH key type and version.
	Example:	• The key type must be ssh-rsa for the configuration of private public key pairs.
	host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1	• This step is optional only if the key-string command is configured.
		 You must configure either the key-string command or the key-hash command.

	Command or Action	Purpose	
		Note You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.	
Step 10	end	Exits public-key data configuration mode and returns to privileged EXEC mode.	
	Example:	• Use no hostname command to return to the default host.	
	host1(conf-ssh-pubkey-data)# end		

Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. hostname name
- 4. ip domain-name name
- 5. crypto key generate rsa
- 6. ip ssh pubkey-chain
- 7. server server-name
- 8. key-string
- 9. exit
- 10. key-hash key-type key-name
- **11**. end
- 12. configure terminal
- 13. ip ssh stricthostkeycheck

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	hostname name	Specifies the hostname.
	Example:	
	Device(config)# hostname host1	
Step 4	ip domain-name name	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.
	Example:	complete unquantieu nostilanies.
	host1(config)# ip domain-name name1	
Step 5	crypto key generate rsa	Generates RSA key pairs.
	Example:	
	host1(config)# crypto key generate rsa	
Step 6	ip ssh pubkey-chain	Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.
	Example:	ı y g
	host1(config)# ip ssh pubkey-chain	
Step 7	server server-name	Enables the SSH server for public-key authentication on the device and enters public-key server configuration mode.
	Example:	
	host1(conf-ssh-pubkey)# server server1	
Step 8	key-string	Specifies the RSA public-key of the remote peer and enters public key data configuration mode.
	Example:	Note You can obtain the public key value from an open SSH
	host1(conf-ssh-pubkey-server)# key-string	client; that is, from the .ssh/id_rsa.pub file.
Step 9	exit	Exits public-key data configuration mode and enters public-key server configuration mode.
	Example:	
	host1(conf-ssh-pubkey-data)# exit	
Step 10	key-hash key-type key-name	(Optional) Specifies the SSH key type and version.

	Command or Action	Purpose
	Example:	The key type must be ssh-rsa for the configuration of private/public key pairs.
	host1(conf-ssh-pubkey-server)# key-hash ssh-rsa key1	 This step is optional only if the key-string command is configured.
		 You must configure either the key-string command or the key-hash command.
		Note You can use a hashing software to compute the hash of the public key string, or you can copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time.
Step 11	end	Exits public-key server configuration mode and returns to privileged EXEC mode.
	Example:	
	host1(conf-ssh-pubkey-server)# end	
Step 12	configure terminal	Enters global configuration mode.
	Example:	
	host1# configure terminal	
Step 13	ip ssh stricthostkeycheck	Ensures that server authentication takes place.
	Example:	The connection is terminated in case of a failure.
	host1(config)# ip ssh stricthostkeycheck	• Use no hostname command to return to the default host.

Starting an Encrypted Session with a Remote Device

Note

The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

SUMMARY STEPS

1. ssh [-v {1 | 2} | -c {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc | 3des | aes192-cbc | aes256-cbc} | -l user-id | -l user-id:vrf-name number ip-address ip-address | -l user-id:rotary number ip-address | -m {hmac-md5-128 | hmac-md5-96 | hmac-sha1-160 | hmac-sha1-96} | -o numberofpasswordprompts n | -p port-num] {ip-addr | hostname} [command | -vrf]

DETAILED STEPS

	Command or Action	Purpose
Step 1	$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$	remote networking device.
	Example:	
	Device# ssh -v 2 -c aes256-ctr -m hmac-shal-96 -l user2 10.76.82.24	

Troubleshooting Tips

The **ip ssh version** command can be used for troubleshooting your SSH configuration. By changing versions, you can determine the SSH version that has a problem.

Enabling Secure Copy Protocol on the SSH Server

Note

The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa authentication login default local
- 5. aaa authorization exec defaultlocal
- **6.** usernamename privilege privilege-level password password
- 7. ip ssh time-outseconds
- 8. ip ssh authentication-retries integer
- 9. ip scpserverenable
- **10**. exit
- 11. debug ip scp

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa new-model	Enables the AAA access control model.
	Example:	
	Device(config)# aaa new-model	
Step 4	aaa authentication login default local	Sets AAA authentication at login to use the local username database for authentication.
	Example:	
	Device(config)# aaa authentication login default local	
Step 5	aaa authorization exec defaultlocal	Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run
	Example:	an EXEC shell, and specifies that the system must use the local database for authorization.
	Device(config)# aaa authorization exec default local	database for authorization.

	Command or Action	Purpose
Step 6	usernamename privilege privilege-level password password	Establishes a username-based authentication system, and specifies the username, privilege level, and an unencrypted password.
	<pre>Example: Device(config) # username samplename privilege 15 password password1</pre>	Note The minimum value for the <i>privilege-level</i> argument is 15. A privilege level of less than 15 results in the connection closing.
Step 7	ip ssh time-outseconds	Sets the time interval (in seconds) that the device waits for the SSH client to respond.
	Example:	-
	Device(config)# ip ssh time-out 120	
Step 8	ip ssh authentication-retries integer	Sets the number of authentication attempts after which the interface is reset.
	Example:	
	Device(config) # ip ssh authentication-retries 3	
Step 9	ip scpserverenable	Enables the device to securely copy files from a remote workstation.
	Example:	
	Device(config)# ip scp server enable	
Step 10	exit	Exits global configuration mode and returns to privileged EXEC mode.
	Example:	
	Device(config)# exit	
Step 11	debug ip scp	(Optional) Provides diagnostic information about SCP authentication problems.
	Example:	
	Device# debug ip scp	

Troubleshooting Tips

To troubleshoot SCP authentication problems, use the **debug ip scp**command.

Verifying the Status of the Secure Shell Connection

SUMMARY STEPS

- 1. enable
- 2. show ssh
- 3. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	show ssh	Displays the status of SSH server connections.
	Example:	
	Device# show ssh	
Step 3	exit	Exits privileged EXEC mode and returns to user EXEC mode.
	Example:	
	Device# exit	

Examples

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

Device# show ssh

Connection Version Encryption State Username 0 1.5 3DES Session started lab

Connection Version Mode Encryption Hmac State
Username 1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

Device# show ssh

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

Device# show ssh

Connection Version Encryption State Username 0 1.5 3DES Session started lab
%No SSHv2 server connections running.

Verifying the Secure Shell Status

SUMMARY STEPS

- 1. enable
- 2. show ip ssh
- 3. exit

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	show ip ssh	Displays the version and configuration data for SSH.
	Example:	
	Device# show ip ssh	
Step 3	exit	Exits privileged EXEC mode and returns to user EXEC mode.
	Example:	
	Device# exit	

Examples

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
Device# show ip ssh

SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

```
Device# show ip ssh

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

```
Device# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
```

Monitoring and Maintaining Secure Shell Version 2

SUMMARY STEPS

- 1. enable
- 2. debug ip ssh
- 3. debug snmp packet

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	debug ip ssh	Enables debugging of SSH.
	Example:	
	Device# debug ip ssh	
Step 3	debug snmp packet	Enables debugging of every SNMP packet sent or received by the device.
	Example:	
	Device# debug snmp packet	

Example

The following sample output from the **debug ip ssh** command shows the connection is an SSH Version 2 connection:

Device# debug ip ssh

```
00:33:55: SSH1: starting SSH control process

00:34:08: SSH2 1: done calc MAC out #14
00:34:08: SSH2 1: send: len 16 (includes padlen 6)
00:34:08: SSH2 1: done calc MAC out #15
00:34:08: SSH1: Session terminated normally
```

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 1

```
Device# configure terminal
Device(config)# ip ssh version 1
```

Example: Configuring Secure Shell Version 2

```
Device# configure terminal
Device(config)# ip ssh version 2
```

Example: Configuring Secure Shell Versions 1 and 2

```
Router# configure terminal
Router(config)# no ip ssh version
```

Example: Starting an Encrypted Session with a Remote Device

```
Device# ssh -v 2 -c aes256-cbc -m hmac-shal-160 -l shaship 10.76.82.24
```

Example: Configuring Server-Side SCP

The following example shows how to configure the server-side functionality for SCP. This example also configures AAA authentication and authorization on the device. This example uses a locally defined username and password.

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication login default local
Device(config)# aaa authorization exec default local
Device(config)# username samplename privilege 15 password password1
Device(config)# ip ssh time-out 120
Device(config)# ip ssh authentication-retries 3
Device(config)# ip scp server enable
```

Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client. For an example of SNMP trap debug output, see the "Example: SNMP Debugging, on page 52" section.

```
snmp-server
snmp-server host a.b.c.d public tty
```

Examples: SSH Keyboard Interactive Authentication

Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

```
Password:
Passwo
```

```
Password:

```

Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

```
Device1# ssh -1 cisco 10.1.1.3

Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]
```

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

```
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password:ciscol
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
```

```
New Password: cisco
Re-enter New password: cisco
Device2>
```

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

```
Device# ssh -1 cisco. 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Device2> exit
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2>
```

Example: SNMP Debugging

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```
Device1# debug snmp packet

SNMP packet debugging is on
Device1# ssh -1 lab 10.0.0.2
Password:

Device2# exit

[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
*Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1 local.9.3.1.1.2.1 = 6

```

```
local.9.2.1.18.2 = lab
*Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
Device1#
```

Examples: SSH Debugging Enhancements

The following is sample output from the **debug ip ssh detail** command. The output provides debugging information about the SSH protocol and channel requests.

Device# debug ip ssh detail 00:04:22: SSHO: starting SSH control process 00:04:22: SSHO: sent protocol version id SSH-1.99-Cisco-1.25 00:04:22: SSHO: protocol version id is - SSH-1.99-Cisco-1.25 00:04:22: SSH2 0: SSH2 MSG KEXINIT sent 00:04:22: SSH2 0: SSH2 MSG KEXINIT received 00:04:22: SSH2:kex: client->server enc:aes128-cbc mac:hmac-sha1 00:04:22: SSH2:kex: server->client enc:aes128-cbc mac:hmac-sha1 00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT 00:04:22: SSH2 0: SSH2 MSG KEXDH INIT received 00:04:22: SSH2: kex derive keys complete 00:04:22: SSH2 0: SSH2 MSG NEWKEYS sent 00:04:22: SSH2 0: waiting for SSH2 MSG NEWKEYS 00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received 00:04:24: SSH2 0: authentication successful for lab 00:04:24: SSH2 0: channel open request 00:04:24: SSH2 0: pty-reg reguest 00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80

The following is sample output from the **debug ip ssh packet** command. The output provides debugging information about the SSH packet.

Device# debug ip ssh packet

00:04:24: SSH2 0: shell request

00:04:24: SSH2 0: shell message received 00:04:24: SSH2 0: starting shell for vty 00:04:38: SSH0: Session terminated normally

```
00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)

00:05:43: SSH2 0: ssh receive: 16 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 136 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 6 bytes
00:05:43: SSH2 0: signature length 143
00:05:43: SSH2 0: send:packet of length 448 (length also includes padlen of 7)
00:05:43: SSH2 0: send:packet of length 16 (length also includes padlen of 10)
00:05:43: SSH2 0: newkeys: mode 1
00:05:43: SSH2 0: ssh receive: 16 bytes received
00:05:43: SSH2 0: input: total packet length of 16 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 8 bytes, maclen 0
```

```
00:05:43: SSH2 0: input: padlength 10 bytes
00:05:43: SSH2 0: newkeys: mode 0
00:05:43: SSH2 0: ssh_receive: 52 bytes received
00:05:43: SSH2 0: input: total packet length of 32 bytes
00:05:43: SSH2 0: partial packet length(block size)16 bytes, needed 16 bytes, maclen 20
00:05:43: SSH2 0: MAC compared for #3 :ok
```

Where to Go Next

You have to use a SSH remote device that supports SSH Version 2, and you have to connect to a Cisco device.

Feature Information for Secure Shell Version 2 Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4: Feature Information for Secure Shell Version 2 Support

Feature Name	Releases	Feature Information
Secure Shell Version 2 Support	12.2(11)T	The Secure Shell Version 2
	12.2(25)S	Support feature allows you to configure Secure Shell (SSH)
	12.3(4)T	Version 2 (SSH Version 1 support
	15.3(2)S	was implemented in an earlier
	15.2(1)E	Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. SSH version 2 also supports AES counter-based encryption mode.
		The following commands were introduced or modified: debug ip ssh, ip ssh min dh size, ip ssh rsa keypair-name, ip ssh version, ssh.
Secure Shell Version 2 Client and	12.0(32)SY	The Cisco IOS image was updated
Server Support	12.3(7)JA	to provide for the automatic generation of SNMP traps when an
	12.4(17)	SSH session terminates.

Feature Name	Releases	Feature Information
SSH Keyboard Interactive Authentication	12.2(33)SXH3 12.4(18)	The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature.
Secure Shell Version 2 Enhancements	12.2(50)SY 12.4(20)T 15.1(2)S	The Secure Shell Version 2 Enhancements feature includes a number of additional capabilities such as support for VRF-aware SSH, SSH debug enhancements, and DH Group 14 and Group 16 exchange support. In Cisco IOS 15.1(2)S, support was added for the Cisco 7600 series router. Note Only the VRF-aware SSH feature is supported in Cisco IOS Release 12.2(50)SY. The following commands were introduced or modified: debug ip ssh, ip ssh dh min size.
Secure Shell Version 2 Enhancements for RSA Keys.	15.0(1)M 15.1(1)S	The Secure Shell Version 2 Enhancements for RSA Keys feature includes a number of additional capabilities to support RSA key-based user authentication for SSH and SSH server host key storage and verification. The following commands were introduced or modified: ip ssh pubkey-chain, ip ssh stricthostkeycheck.

SSH Terminal-Line Access

The SSH Terminal-Line Access feature provides users secure access to tty (text telephone) lines. tty allows the hearing- and speech-impaired to communicate by using a telephone to type messages.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for SSH Terminal-Line Access

Download the required image to your router. The secure shell (SSH) server requires the router to have an IPSec (Data Encryption Standard (DES) or 3DES) encryption software image from Cisco IOS Release 12.1(1)T or a later release. The SSH client requires the router to have an IPSec (DES or 3DES) encryption software image from Cisco IOS Release 12.1(3)T or a later release. See the *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.4T for more information on downloading a software image.

The SSH server requires the use of a username and password, which must be defined through the use of a local username and password, TACACS+, or RADIUS.

The SSH Terminal-Line Access feature is available on any image that contains SSH.

Restrictions for SSH Terminal-Line Access

Console Server Requirement

To configure secure console server access, you must define each line in its own rotary and configure SSH to use SSH over the network when user want to access each of those devices.

Memory and Performance Impact

Replacing reverse Telnet with SSH may reduce the performance of available tty lines due to the addition of encryption and decryption processing above the vty processing. (Any cryptographic mechanism uses more memory than a regular access.)

Information About SSH Terminal-Line Access

Overview of SSH Terminal-Line Access

Cisco IOS supports reverse Telnet, which allows users to Telnet through the router--via a certain port range--to connect them to tty (asynchronous) lines. Reverse Telnet has allowed users to connect to the console ports of remote devices that do not natively support Telnet. However, this method has provided very little security because all Telnet traffic goes over the network in the clear. The SSH Terminal-Line Access feature replaces reverse Telnet with SSH. This feature may be configured to use encryption to access devices on the tty lines, which provide users with connections that support strong privacy and session integrity.

SSH is an application and a protocol that provides secure replacement for the suite of Berkeley r-tools such as rsh, rlogin, and rcp. (Cisco IOS supports rlogin.) The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Currently two versions of SSH are available: SSH Version 1 and SSH Version 2. Only SSH Version 1 is implemented in the Cisco IOS software.

The SSH Terminal-Line Access feature enables users to configure their router with secure access and perform the following tasks:

- Connect to a router that has multiple terminal lines connected to consoles or serial ports of other routers, switches, or devices.
- Simplify connectivity to a router from anywhere by securely connecting to the terminal server on a specific line.
- Allow modems attached to routers to be used for dial-out securely.
- Require authentication of each of the lines through a locally defined username and password, TACACS+, or RADIUS.

Note

The **session slot** command that is used to start a session with a module requires Telnet to be accepted on the virtual tty (vty) lines. When you restrict vty lines only to SSH, you cannot use the command to communicate with the modules. This applies to any Cisco IOS device where the user can telnet to a module on the device.

How to Configure SSH Terminal-Line Access

Configuring SSH Terminal-Line Access

Perform this task to configure a Cisco router to support reverse secure Telnet.

Note

SSH must already be configured on the router.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. line** *line-number* [*ending-line-number*]
- 4. no exec
- **5.** login {local | authentication listname}
- 6. rotary group
- 7. transport input {all | ssh}
- 8. exit
- 9. ip ssh port portnum rotary group

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	

	Command or Action	Purpose	
Step 3	line line-number [ending-line-number]	Identifies a line for configuration and enters line configuration mode.	
	Example: Router(config) # line 1 200	Note For router console configurations, each line must be defined in its own rotary, and SSH must be configured to listen in on each rotary. Note An authentication method requiring a username and password must be configured for each line. This may be done through the use of a local username and password stored on the router, through the use of TACACS+, or through the use of RADIUS. Neither Line passwords nor the enable password are sufficient to be used with SSH.	
Step 4	no exec	Disables exec processing on each of the lines.	
	<pre>Example: Router(config-line) # no exec</pre>		
Step 5	<pre>login {local authentication listname} Example: Router(config-line) # login authentication default</pre>	Defines a login authentication mechanism for the lines. Note The authentication method must utilize a username and password.	
Step 6	rotary group	Defines a group of lines consisting of one or more lines.	
otop o	<pre>Example: Router(config-line)# rotary 1</pre>	Note All rotaries used must be defined, and each defined rotary must be used when SSH is enabled.	
Step 7	transport input {all ssh}	Defines which protocols to use to connect to a specific line of the router.	
	<pre>Example: Router(config-line)# transport input ssh</pre>		
Step 8	exit	Exits line configuration mode.	
	<pre>Example: Router(config-line)# exit</pre>		
Step 9	ip ssh port portnum rotary group	Enables secure network access to the tty lines.	
	Example: Router(config) # ip ssh port 2000	• Use this command to connect the <i>portnum</i> argument with the rotary <i>group</i> argument, which is associated with a line or group of lines.	
	rotary 1	Note The <i>group</i> argument must correspond with the rotary <i>group</i> number chosen in Step 6.	

Verifying SSH Terminal-Line Access

To verify that this functionality is working, you can connect to a router using an SSH client.

Configuration Examples for SSH Terminal-Line Access

Example SSH Terminal-Line Access Configuration

The following example shows how to configure the SSH Terminal-Line Access feature on a modem used for dial-out on lines 1 through 200. To get any of the dial-out modems, use any SSH client and start an SSH session to port 2000 of the router to get to the next available modem from the rotary.

```
line 1 200
no exec
login authentication default
rotary 1
transport input ssh
exit
ip ssh port 2000 rotary 1
```

Example SSH Terminal-Line Access for a Console Serial Line Ports Configuration

The following example shows how to configure the SSH Terminal-Line Access feature to access the console or serial line interface of various devices. For this type of access, each line is put into its own rotary, and each rotary is used for a single port. In this example, lines 1 through 3 are used; the port (line) mappings of the configuration are shown in the table below.

Table 5: Port (line) Configuration Mappings

Line Number	SSH Port Number
1	2001
2	2002
3	2003

```
line 1
no exec
login authentication default
rotary 1
transport input ssh
line 2
```

no exec login authentication default rotary 2 transport input ssh line 3 no exec login authentication default rotary 3 transport input ssh ip ssh port 2001 rotary 1 3

Restrictions for Secure Shell—Configuring User Authentication Methods

Secure Shell (SSH) server and SSH client are supported on data encryption software (DES) (56-bit) and 3DES (168-bit) images only.

Information About Secure Shell—Configuring User Authentication Methods

Secure Shell User Authentication Overview

Secure Shell (SSH) enables an SSH client to make a secure, encrypted connection to a Cisco device (Cisco IOS SSH server). The SSH client uses the SSH protocol to provide device authentication and encryption.

The SSH server supports three types of user authentication methods and sends these authentication methods to the SSH client in the following predefined order:

- Public-key authentication method
- Keyboard-interactive authentication method
- · Password authentication method

By default, all the user authentication methods are enabled. Use the **no ip ssh server authenticate user** {**publickey** | **keyboard** | **pasword**} command to disable any specific user authentication method so that the disabled method is not negotiated in the SSH user authentication protocol. This feature helps the SSH server offer any preferred user authentication method in an order different from the predefined order. The disabled user authentication method can be enabled using the **ip ssh server authenticate user** {**publickey** | **keyboard** | **pasword**} command.

As per RFC 4252 (The Secure Shell (SSH) Authentication Protocol), the public-key authentication method is mandatory. This feature enables the SSH server to override the RFC behavior and disable any SSH user authentication method, including public-key authentication.

For example, if the SSH server prefers the password authentication method, the SSH server can disable the public-key and keyboard-interactive authentication methods.

How to Configure Secure Shell—Configuring User Authentication Methods

Configuring User Authentication for the SSH Server

Perform this task to configure user authentication methods in the Secure Shell (SSH) server.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. no ip ssh server authenticate user {publickey | keyboard | pasword}
- 4. ip ssh server authenticate user {publickey | keyboard | pasword}
- 5. default ip ssh server authenticate user
- 6. end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	no ip ssh server authenticate user {publickey keyboard pasword}	Disables a user authentication method in the Secure Shell (SSH) server.	
	Example:	Note A warning message is displayed when the no ip ssh server authenticate user publickey command is used to disable public-key authentication. This command	
	Device(config) # no ip ssh server authenticate user publickey		
	%SSH:Publickey disabled.Overriding RFC	public-key authentication is mandatory.	
Step 4	ip ssh server authenticate user {publickey keyboard pasword}	Enables the disabled user authentication method in the SSH server.	
	Example:		
	Device(config)# ip ssh server authenticate user publickey		
Step 5	default ip ssh server authenticate user	Returns to the default behavior in which all user authentication methods are enabled in the predefined order.	
	Example:	_	
	Device(config) # default ip ssh server authenticate user		

	Command or Action	Purpose
Step 6	end	Exits global configuration mode and returns to privileged EXEC mode.
	Example:	
	Device(config)# end	

Troubleshooting Tips

If the public-key-based authentication method is disabled using the no ip ssh server authenticate user
publickey command, the RFC 4252 (The Secure Shell (SSH) Authentication Protocol) behavior in
which public-key authentication is mandatory is overridden and the following warning message is
displayed:

%SSH:Publickey disabled.Overriding RFC

• If all three authentication methods are disabled, the following warning message is displayed:

%SSH:No auth method configured. Incoming connection will be dropped

• In the event of an incoming SSH session request from the SSH client when all three user authentication methods are disabled on the SSH server, the connection request is dropped at the SSH server and a system log message is available in the following format:

 $SSH-3-NO_USERAUTH:$ No auth method configured for SSH Server. Incoming connection from <code><ip address></code> (tty = <code><ttynum></code>) dropped

Verifying User Authentication for the SSH Server

SUMMARY STEPS

- 1. enable
- 2. show ip ssh

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

• Enter your password if prompted.

Example:

Device> enable

Step 2 show ip ssh

Displays the version and configuration data for Secure Shell (SSH).

Example:

The following sample output from the **show ip ssh** command confirms that all three user authentication methods are enabled in the SSH server:

```
Device# show ip ssh
Authentication methods:publickey,keyboard-interactive,password
```

The following sample output from the **show ip ssh** command confirms that all three user authentication methods are disabled in the SSH server:

```
Device# show ip ssh
Authentication methods:NONE
```

Configuration Examples for Secure Shell—Configuring User Authentication Methods

Example: Disabling User Authentication Methods

The following example shows how to disable the public-key-based authentication and keyboard-based authentication methods, allowing the SSH client to connect to the SSH server using the password-based authentication method:

```
Device> enable
Device# configure terminal
Device(config)# no ip ssh server authenticate user publickey
%SSH:Publickey disabled.Overriding RFC
Device(config)# no ip ssh server authenticate user keyboard
Device(config)# exit
```

Example: Enabling User Authentication Methods

The following example shows how to enable the public-key-based authentication and keyboard-based authentication methods:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh server authenticate user publickey
Device(config)# ip ssh server authenticate user keyboard
Device(config)# exit
```

Example: Configuring Default User Authentication Methods

The following example shows how to return to the default behavior in which all three user authentication methods are enabled in the predefined order:

```
Device> enable
Device# configure terminal
Device(config)# default ip ssh server authenticate user
Device(config)# exit
```

Feature Information for Secure Shell—Configuring User Authentication Methods

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 7: Feature Information for Secure Shell—Configuring User Authentication Methods

Feature Name	Releases	Feature Information
Secure Shell—Configuring User Authentication Methods	15.3(3)M	The Secure Shell—Configuring User Authentication Methods feature helps configure the user authentication methods available in the Secure Shell (SSH) server. The following command was introduced: ip ssh server authenticate user.

Feature Information for Secure Shell—Configuring User Authentication Methods

AES-CTR Support for SSHv2

The AES-CTR Support for SSHv2 feature provides increased security through support for the Advanced Encryption Standard counter (AES-CTR) encryption mode during an encrypted Secure Shell version 2 (SSHv2) session between the server and the client.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AES-CTR Support for SSHv2

- Ensure that you use a Secure Shell (SSH) remote device that supports SSH Version 2 (SSHv2) and connect to a Cisco device.
- Ensure that both the client and the server that are used in the SSH session support the Advanced Encryption Standard counter mode (AES-CTR) encryption mode.

Restrictions for AES-CTR Support for SSHv2

• The Secure Shell (SSH) server and SSH client are supported only on crypto k9 (Triple Data Encryption Standard [3DES]) software images depending on your release.

Information About AES-CTR Support for SSHv2

Secure Shell Version 2 Encryption Modes

The Cisco Secure Shell (SSH) implementation enables a secure, encrypted connection between a server and client. The SSH servers and clients use the SSH protocol to provide device authentication and encryption.

To start an encrypted session between the SSH client and server, the preferred mode of encryption needs to be decided. For increased security, the preferred crypto algorithm for the SSH session is the Advanced Encryption Standard counter mode (AES-CTR).

SSH version 2 (SSHv2) supports AES-CTR encryption for 128-, 192-, and 256-bit key length. From the supported AES-CTR algorithms, the preferred algorithm is chosen based on the processing capability. The greater the length of the key, the stronger the encryption.

The Cisco SSH servers and clients support three types of crypto algorithms to encrypt data and selects the encryption mode in the following order of preferred encryption:

- AES-CTR
- AES Cipher Block Chaining (AES-CBC)
- Triple Data Encryption Standard (3DES)

If the SSH session uses a remote device that does not support the AES-CTR encryption mode, then the encryption mode for the session falls back to AES-CBC mode.

How to Configure AES-CTR Support for SSHv2

Starting an Encrypted Session from the SSH Client

Perform this task to start an encrypted Secure Shell (SSH) session from the SSH client using the Advanced Encryption Standard counter mode (AES-CTR) encryption mode.

Note

The device with which you want to connect must support an SSH server that has the AES-CTR encryption algorithm that is supported in Cisco software. SSH can be run even when the device is disabled.

SUMMARY STEPS

- 1. enable
- 2. ssh [-v {1 | 2} | -c {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc | 3des | aes192-cbc | aes256-cbc} | -l user-id | -l user-id:vrf-name number ip-address ip-address | -l user-id:rotary number ip-address | -m {hmac-md5-128 | hmac-md5-96 | hmac-sha1-160 | hmac-sha1-96} | -o numberofpasswordprompts n | -p port-num] {ip-addr | hostname} [command | -vrf]
- 3. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	Enter your password if prompted.
Step 2	ssh [-v {1 2} -c {aes128-ctr aes192-ctr aes256-ctr aes128-cbc 3des aes192-cbc aes256-cbc} -l user-id -l user-id:vrf-name number ip-address ip-address -l user-id:rotary number ip-address -m {hmac-md5-128 hmac-md5-96 hmac-sha1-160 hmac-sha1-96} -o numberofpasswordprompts n -p port-num] {ip-addr hostname} [command -vrf] Example:	Starts an encrypted session with a remote networking device.
	Device# ssh -v 2 -c aes256-ctr -m hmac-shal-96 -l user2 10.76.82.24	
Step 3	exit	Exits privileged EXEC mode.
	Example: Device# exit	

Verifying the Encryption Mode Used in the SSH Server or Client

SUMMARY STEPS

- 1. enable
- 2. show ssh
- 3. debug ip ssh detail

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

• Enter your password if prompted.

Example:

Device> enable

Step 2 show ssh

Displays the encryption algorithms used for an encrypted session.

Example:

The following sample output from the **show ssh** command shows that the AES-CTR encryption mode is used for the session between the SSH server and client:

Device# show ssh

```
Connection Version Mode Encryption Hmac State Username

0 1.99 IN aes128-ctr hmac-shal Session started cisco
0 1.99 OUT aes128-ctr hmac-shal Session started cisco
%No SSHv1 server connections running.
```

Step 3 debug ip ssh detail

Displays the version and configuration data for Secure Shell (SSH).

Example:

The following sample output from the **debug ip ssh detail** command in the SSH server shows that the AES-CTR encryption mode is used for the session between the SSH server and client:

```
Device# debug ip ssh detail

SSH2 0: kex: client->server enc:aes128-ctr mac:hmac-md5
SSH2 0: kex: server->client enc:aes128-ctr mac:hmac-md5
```

SSH2 CLIENT 0: kex: client->server enc:aes128-ctr mac:hmac-md5

The following sample output from the **debug ip ssh detail** command in the SSH client shows that the AES-CTR encryption mode is used for the session between the SSH server and client:

```
Device# debug ip ssh detail
SSH2 CLIENT 0: kex: server->client enc:aes128-ctr mac:hmac-md5
```

Configuration Examples for AES-CTR Support for SSHv2

Example: Starting an Encrypted Session from the SSH Client

The following example shows how to start an encrypted Secure Shell (SSH) session from the SSH client using the Advanced Encryption Standard counter mode (AES-CTR) encryption mode:

```
Device> enable
Device# ssh -v 2 -c aes256-ctr -m hmac-sha1-96 -l user2 10.76.82.24
Device# exit
```
